

# Completing the Square

---

Completing the square is an algebraic technique for converting a standard quadratic expression

$$ax^2 + bx + c$$

into one of the form

$$(\alpha x + \beta)^2 + \gamma$$

# Completing the Square

---

Completing the square is an algebraic technique for converting a standard quadratic expression

$$ax^2 + bx + c$$

into one of the form

$$(\alpha x + \beta)^2 + \gamma$$

We start by equating the two expressions:

$$ax^2 + bx + c = (\alpha x + \beta)^2 + \gamma = \alpha^2 x^2 + 2\alpha\beta x + \beta^2 + \gamma$$

# Completing the Square

---

$$ax^2 + bx + c = \alpha^2 x^2 + 2\alpha\beta x + \beta^2 + \gamma$$

Two polynomials are equal if and only if their coefficients are the same for each power of  $x$ .

# Completing the Square

---

$$ax^2 + bx + c = \alpha^2 x^2 + 2\alpha\beta x + \beta^2 + \gamma$$

Two polynomials are equal if and only if their coefficients are the same for each power of  $x$ .

That means we can write three equations, one for each power of  $x$ :

- $a = \alpha^2$

- $b = 2\alpha\beta$

- $c = \beta^2 + \gamma$

# Completing the Square

---

Starting with the easiest one, we first solve for  $\alpha$ :

$$a = \alpha^2 \quad \text{so} \quad \alpha = \sqrt{a}$$

# Completing the Square

---

Starting with the easiest one, we first solve for  $\alpha$ :

$$a = \alpha^2 \quad \text{so} \quad \alpha = \sqrt{a}$$

Next

$$b = 2\alpha\beta \quad \text{so} \quad \beta = \frac{b}{2\alpha} = \frac{b}{2\sqrt{a}}$$

# Completing the Square

---

Starting with the easiest one, we first solve for  $\alpha$ :

$$a = \alpha^2 \quad \text{so} \quad \alpha = \sqrt{a}$$

Next

$$b = 2\alpha\beta \quad \text{so} \quad \beta = \frac{b}{2\alpha} = \frac{b}{2\sqrt{a}}$$

Finally

$$c = \beta^2 + \gamma \quad \text{so} \quad \gamma = c - \beta^2 = c - \frac{b^2}{4a}$$

# Completing the Square

---

In summary, if

$$ax^2 + bx + c = (\alpha x + \beta)^2 + \gamma$$

then:

- $\alpha = \sqrt{a}$

- $\beta = \frac{b}{2\sqrt{a}}$

- $\gamma = c - \frac{b^2}{4a}$

# Completing the Square

---

In summary, if

$$ax^2 + bx + c = (\alpha x + \beta)^2 + \gamma$$

then:

$$\bullet \quad \alpha = \sqrt{a}$$

$$\bullet \quad \beta = \frac{b}{2\sqrt{a}}$$

$$\bullet \quad \gamma = c - \frac{b^2}{4a}$$

Note: If  $a < 0$ , first write the quadratic as

$$-(ax^2 + bx + c) = -[(\alpha x + \beta)^2 + \gamma]$$

---

# Question 1

---

Write the quadratic

$$x^2 + 8x + 5 \quad \text{in the form} \quad (\alpha x + \beta)^2 + \gamma$$

1.  $(x - 4)^2 + 9$

4.  $(x - 4)^2 - 9$

2.  $(x + 2)^2 - 3$

5.  $(x + 2)^2 - 9$

3.  $(x + 4)^2 - 9$

6. none of the above

# Question 1

---

Write the quadratic

$$x^2 + 8x + 5 \quad \text{in the form} \quad (\alpha x + \beta)^2 + \gamma$$

1.  $(x - 4)^2 + 9$

4.  $(x - 4)^2 - 9$

2.  $(x + 2)^2 - 3$

5.  $(x + 2)^2 - 9$

3.  $(x + 4)^2 - 9$

6. none of the above

3.  $(x + 4)^2 - 9$

# Completing the Square

---

We want to find  $\alpha$ ,  $\beta$ , and  $\gamma$  so that:

$$x^2 + 8x + 5 = (\alpha x + \beta)^2 + \gamma$$

then since  $a = 1$ ,  $b = 8$ , and  $c = 5$ ,

- $\alpha = \sqrt{a} = 1$

- $\beta = \frac{b}{2\sqrt{a}} = \frac{8}{2\sqrt{1}} = 4$

- $\gamma = c - \frac{b^2}{4a} = 5 - \frac{8^2}{4 \cdot 1} = 5 - 16 = -11$

# Completing the Square

---

We want to find  $\alpha$ ,  $\beta$ , and  $\gamma$  so that:

$$x^2 + 8x + 5 = (\alpha x + \beta)^2 + \gamma$$

then since  $a = 1$ ,  $b = 8$ , and  $c = 5$ ,

$$\bullet \quad \alpha = \sqrt{a} = 1$$

$$\bullet \quad \beta = \frac{b}{2\sqrt{a}} = \frac{8}{2\sqrt{1}} = 4$$

$$\bullet \quad \gamma = c - \frac{b^2}{4a} = 5 - \frac{8^2}{4 \cdot 1} = 5 - 16 = -11$$

One can easily check that

$$x^2 + 8x + 5 = (x + 4)^2 - 11$$

---

# Question 2

---

Write the quadratic

$$x^2 + x + 1 \quad \text{in the form} \quad (\alpha x + \beta)^2 + \gamma$$

1.  $(x + \frac{1}{2})^2 - \frac{3}{4}$

4.  $(x - \frac{1}{2})^2 + \frac{1}{4}$

2.  $(x + \frac{1}{2})^2 + \frac{3}{4}$

5.  $(x + \frac{1}{2})^2 + \frac{1}{4}$

3.  $(x - \frac{1}{2})^2 - \frac{3}{4}$

6. none of the above

# Question 2

---

Write the quadratic

$$x^2 + x + 1 \quad \text{in the form} \quad (\alpha x + \beta)^2 + \gamma$$

1.  $(x + \frac{1}{2})^2 - \frac{3}{4}$

4.  $(x - \frac{1}{2})^2 + \frac{1}{4}$

2.  $(x + \frac{1}{2})^2 + \frac{3}{4}$

5.  $(x + \frac{1}{2})^2 + \frac{1}{4}$

3.  $(x - \frac{1}{2})^2 - \frac{3}{4}$

6. none of the above

2.  $(x + \frac{1}{2})^2 + \frac{3}{4}$

# Completing the Square

---

We want to find  $\alpha$ ,  $\beta$ , and  $\gamma$  so that:

$$x^2 + x + 1 = (\alpha x + \beta)^2 + \gamma$$

then since  $a = 1$ ,  $b = 1$ , and  $c = 1$ ,

- $\alpha = \sqrt{a} = 1$

- $\beta = \frac{b}{2\sqrt{a}} = \frac{1}{2\sqrt{1}} = \frac{1}{2}$

- $\gamma = c - \frac{b^2}{4a} = 1 - \frac{1^2}{4 \cdot 1} = \frac{3}{4}$

# Completing the Square

---

We want to find  $\alpha$ ,  $\beta$ , and  $\gamma$  so that:

$$x^2 + x + 1 = (\alpha x + \beta)^2 + \gamma$$

then since  $a = 1$ ,  $b = 1$ , and  $c = 1$ ,

•  $\alpha = \sqrt{a} = 1$

•  $\beta = \frac{b}{2\sqrt{a}} = \frac{1}{2\sqrt{1}} = \frac{1}{2}$

•  $\gamma = c - \frac{b^2}{4a} = 1 - \frac{1^2}{4 \cdot 1} = \frac{3}{4}$

One can easily check that

$$x^2 + x + 1 = \left(x + \frac{1}{2}\right)^2 + \frac{3}{4}$$

---
